

RATIONALE

- Residents are locally responsible for code and rapid response leadership. Learning occurs via exposure and simulation.
- Traditional teaching emphasizes algorithms and technical steps, with less focus on leadership, communication, and team dynamics.
- Prior safety analyses and feedback highlight unclear leadership, missed shockable-rhythm decisions, and delayed escalation.

CURRICULUM DESIGN

4 web-based modules (~60 min total), completed asynchronously prior to PGY-2 start.

Modules :

- Leadership skills for code blue and rapid response teams
- Rhythm strip recognition and management
- Resources at the bedside (medications, equipment, roles)
- Ending the event and structured debrief

Simulation block:

- 3 facilitated case scenarios with an intensivist
- Hands-on Zoll defibrillator practice (defib, pacing, rhythm interpretation)
- Group debrief after each scenario

METHODS

- Single-center IM residency. Pre/post surveys rated self-reported confidence (not clinical competence) on five 1–10 items: code leadership, rapid-response leadership, rhythm interpretation, team dynamics, and attending-call tendency.
- Post-seminar survey rated helpfulness of modules, clinical cases, and group debriefing.
- Paired t-tests for pre→post change; linear regression for per-event slopes.

MAIN TAKEAWAY

- Prior rapid-response exposure tracked with **lower** team-management confidence; code and simulation exposure tracked with **higher** confidence.**
- The seminar produced a clear gain in rhythm-recognition confidence (+1.63 / 10).**
- No significant change in confidence regarding team-dynamics manage or in attending-call tendency.**

+0.49

**per code blue
attended**

95% CI: +0.00 to +0.81

+0.47

**per simulation
completed**

95% CI: +0.00 to +0.94

-0.07

**per rapid response
attended**

95% CI: -0.50 to +0.03 (n.s.)

SURVEY RESPONSES

Prior Event Experience (n=31, pre-survey)	Median [IQR]
Number of Rapid Responses Attended as an Intern	15 [10 to 17.5]
Number of Code Blues Attended as an Intern	3 [1.5 to 4]
Number of Simulations Attended as an Intern	1 [0.25 to 2]

Ratings of Curricular Components (n=23, paired)	Median [IQR]
Perceived effectiveness of lecture modules (1-10)	9 [8 to 10]
Perceived effectiveness of case simulation (1-10)	9 [8 to 10]
Perceived effectiveness of lecture discussion (1-10)	9 [7.5 to 10]

Team-Leadership Confidence Association with prior exposure (n=23, post-survey)	Change per event attended (95% CI)
Per rapid response attended	-0.07 (-0.17 to 0.03)
Per code blue attended	0.47 (0.03 to 0.94)
Per simulation attended	0.49 (0.13 to 0.81)

Pre-to-Post Change (n=23, paired)	Mean change (95% CI)
Team-dynamics confidence	-0.41 (-1.53 to 0.72)
Attending-call tendency	0.05 (-0.56 to 0.65)
Rhythm strip recognition	1.63 (1 to 2.27)

Team-Leadership Confidence Effects — FOREST PLOT

Mean change after seminar (top) and change per prior event attended (bottom), with 95% CI

Pre→post change after seminar

Rhythm-strip recognition

Team-dynamics confidence

Attending-call tendency

Per prior event attended (leadership confidence)

Per code blue attended

Per simulation attended

Per rapid response attended

FINDINGS

31 pre-surveys

74% completed pre and post

**23 paired
completions**

- Codes attended (+0.49/event) and simulations completed (+0.47/event) were associated with higher team-leadership confidence; rapid-response attendance (-0.07/event) was not.
- The seminar produced a clear gain in rhythm-recognition confidence (+1.63/10).
- Team-dynamics confidence and attending-call tendency did not substantially change after the seminar.

Helpfulness ratings: 9/10 median across modules, case simulation, and discussion.

CONCLUSION

This pattern suggests rapid-response exposure alone may not build team-leadership confidence; structured practice through codes and simulations appears more associated with it.

Future iterations will emphasize structured practice and feedback for uncertainty in rapid responses.

Findings reflect a single-center sample; non-completers (26%) may differ from completers.
